Exp.No.: 3 Map Reduce program to process a weather dataset

AIM:

To implement MapReduce program to process a weather dataset.

Procedure:

Step 1: Create Data File:

Create a file named "word_count_data.txt" and populate it with text data that you wish to analyse. Login with your hadoop user.

Download the dataset (weather data)

Output:

Step 2: Mapper Logic - mapper.py:

Create a file named "mapper.py" to implement the logic for the mapper. The mapper will read input data from STDIN, split lines into words, and output each word with its count.

```
nano mapper.py
# Copy and paste the mapper.py code
```

```
#!/usr/bin/env python

import sys

# input comes from STDIN (standard input)
# the mapper will get daily max temperature and group it by month. so output will be
(month,dailymax_temperature)
for line in sys.stdin:
    # remove leading and trailing whitespace
    line = line.strip()
# split the line into words
words = line.split()
    #See the README hosted on the weather website  which help us understand how each
position represents a column      month = line[10:12]      daily_max = line[38:45]      daily_max
= daily_max.strip()
    # increase counters      for
word in words:
        # write the results to STDOUT (standard output);
        # what we output here will be go through the shuffle proess and then
        # be the input for the Reduce step, i.e. the input for reducer.py
        #
        # tab-delimited; month and daily max temperature as output
print ('%s\t%s' % (month ,daily_max))

          .
```

Step 3: Reducer Logic - reducer.py:

Create a file named "reducer.py" to implement the logic for the reducer. The reducer will aggregate the occurrences of each word and generate the final output.

```
nano reducer.py
# Copy and paste the reducer.py code
```

reducer.py

```
#!/usr/bin/env python

from operator import itemgetter import sys
#reducer will get the input from stdid which will be a collection of key, value(Key=month , value=
daily max temperature)
#reducer logic: will get all the daily max temperature for a month and find max temperature for the
month
#shuffle will ensure that key are sorted(month)
```

```
current_month = None
current_max = 0 month =
None

# input comes from STDIN for
line in sys.stdin:
   # remove leading and trailing whitespace     line
= line.strip()
   # parse the input we got from mapper.py     month,
daily_max = line.split('\t', 1)

   # convert daily_max (currently a string) to float     try:
      daily_max = float(daily_max)     except
ValueError:
      # daily_max was not a number, so silently
      # ignore/discard this line
continue

   # this IF-switch only works because Hadoop shuffle process sorts map output
   # by key (here: month) before it is passed to the reducer
if current_month == month:         if daily_max > current_max:
current_max = daily_max     else:         if current_month:
          # write result to STDOUT
          print ('%s\t%s' % (current_month, current_max))
current_max = daily_max
      current_month = month

# output of the last month if current_month == month:
print ('%s\t%s' % (current_month, current_max))
```

Step 4: Prepare Hadoop Environment:

Start the Hadoop daemons and create a directory in HDFS to store your data.

```
start-all.sh
```

Step 6: Make Python Files Executable:

Give executable permissions to your mapper.py and reducer.py files.

```
chmod 777 mapper.py reducer.py
```

```
hadoop@priyav-VirtualBox:~/weather$ chmod 777 mapper.py reducer.py
hadoop@priyav-VirtualBox:~/weather$ hadoop fs -mkdir -p /weatherdata
hadoop fs -copyFromLocal /home/hadoop/weather/weather_data.txt /weatherdata

hadoop@priyav-VirtualBox:~/weather$ hdfs dfs -ls /weatherdata
Found 1 items
-rw-r--r--   3 hadoop supergroup        425 2024-09-02 11:13 /weatherdata/weather_d
ata.txt
```

Step 7: Run the program using Hadoop Streaming:

Download the latest hadoop-streaming jar file and place it in a location you can easily access.

Then run the program using Hadoop Streaming.

```
hadoop fs -mkdir -p /weatherdata

hadoop fs -copyFromLocal /home/sx/Downloads/dataset.txt /weatherdata

hdfs dfs -ls /weatherdata

hadoop jar /home/sx/hadoop-3.2.3/share/hadoop/tools/lib/hadoop-streaming-3.2.3.jar \
  -input /weatherdata/dataset.txt \
  -output /weatherdata/output \
  -file "/home/sx/Downloads/mapper.py" \
  -mapper "python3 mapper.py" \
  -file "/home/sx/Downloads/reducer.py" \
  -reducer "python3 reducer.py"

hdfs dfs -text /weatherdata/output/* > /home/sx/Downloads/outputfile.txt
```

```
hadoop@priyav-VirtualBox:~/weather$ hadoop jar /home/hadoop/hadoop/share/hadoop/tools/lib/hadoop-streaming-3.3.6.jar -inp
ut /weatherdata/weather_data.txt -output /weatherdata/output -file /home/hadoop/weather/mapper.py -mapper "python3 mapper
.py" -file /home/hadoop/weather/reducer.py -reducer "python3 reducer.py"
2024-09-02 11:38:53,541 WARN streaming.StreamJob: -file option is deprecated, please use generic option -files instead.

 directory:false, ignore cleanup failures: false
```

Step 8: Check Output:

Check the output of the program in the specified HDFS output directory.

hdfs dfs -text /weatherdata/output/* > /home/sx/Downloads/output/ /part-00000

```
hadoop@priyav-VirtualBox:~/weather$ hadoop fs -ls /weatherdata/output
Found 2 items
-rw-r--r--   3 hadoop supergroup          0 2024-09-02 11:38 /weatherdata/output/_SUCCESS
-rw-r--r--   3 hadoop supergroup         48 2024-09-02 11:38 /weatherdata/output/part-00000
hadoop@priyav-VirtualBox:~/weather$ hadoop fs -cat /weatherdata/output/part-00000
01      26.1
02      29.1
03      33.6
04      36.1
05      42.1
06      44.0
hadoop@priyav-VirtualBox:~/weather$
```

After copy and paste the above output in your local file give the below command to remove the directory from hdfs : hadoop fs -rm -r /weatherdata/output

Result:

Thus, the program for weather dataset using Map Reduce has been executed successfully.
